

Men Health Check Up Ultrasound of 10/04/2026

Mr. Rasmus FRIIS, born on 09/01/1975 (51 years)

PIN: LPU30950

Clinical Indication: Check-up

These ultrasound examinations are performed with the patient's verbal consent.

Carotid Doppler scan:

There are a few small and shallow mixed plaques in the left distal CCA, carotid bulb/proximal ICA, causing no haemodynamically significant stenosis.

There is no evidence of significant stenosis in the CCA, ICA, carotid bulb, and origin of the ECA bilaterally.

Normal waveforms, ratios, and velocities are demonstrated; Doppler flow profiles are normal.

No high-velocity jets, spectral broadening, or aliasing is seen.

Right CIMT measures 0.6 mm.

Thyroid scan:

The thyroid gland appears normal in size, shape and echotexture.

The isthmus appears normal in thickness and echotexture; it measures 3.2 mm.

Normal vascularity is demonstrated in the thyroid parenchyma.

The right lobe measures 51 x 19 x 30 mm.

The left lobe measures 45 x 15 x 22 mm.

A hypoechoic thyroid nodule is noted in the left lobe, measuring 4 x 3 mm; the ultrasound appearance is suggestive of a U2 nodule.

No retrosternal extension of the thyroid is seen.

No abnormal cervical lymph nodes are noted.

The parotid and submandibular glands appear unremarkable bilaterally.

Abdominal scan:

The liver appears normal in size, smooth in outline, and homogeneous in echotexture, with normal echogenicity.

No focal lesions are seen. No intrahepatic duct dilatation is seen.

The hepatic vein, portal vein, and hepatic artery are patent with normal flow.

There is a nonmobile echogenic focus on the gallbladder wall, consistent with a polyp measuring 5 mm, for which a follow-up scan in 6 months is recommended.

The CBD is of normal calibre.

The midline structures of the pancreas and abdominal aorta appear normal.

The spleen measures 105 mm and is not enlarged.

No free fluid is seen.

KUB scan:

Both kidneys appear normal in size, shape, and echo pattern.

Cortico-medullary differentiation is preserved. Normal cortical thickening is noted.

No sonographic evidence of calculi or hydronephrosis is identified in either kidney.

The right kidney measures 120 mm, and the left kidney measures 110 mm.

The bladder is fairly distended; it appears grossly normal in wall thickening and contour.

The prostate gland is at the upper limit of the normal size, measuring 43 x 36 x 37 mm, with a volume of 30 ml.

Testes scan:

A testicular ultrasound examination is performed with the patient's verbal consent.

Both testes appear normal in size, shape and echotexture.

No evidence of focal intratesticular lesions is identified.

Normal intra-testicular vascularity is noted in both testicles' parenchyma.

The right testis measures 59 x 27 x 35 mm.

The left testis measures 60 x 22 x 33 mm.

Both epididymides appear normal in shape, size and echotexture.

There are small cysts in the heads of the epididymis bilaterally, measuring 4 x 2 mm and 4 x 2 mm; otherwise, both epididymides appear normal in shape, size, and echotexture.

Normal epididymal vascularity is demonstrated bilaterally.

Bilaterally, there is no evidence of a hydrocele.

Mild varicocele is seen on the left side, measuring 3.8 mm.
No abnormal masses or fluid collections are noted.

Conclusion:

Carotid:

Shallow and small mixed plaques in the left distal CCA/Carotid bulb; otherwise unremarkable Doppler study

Thyroid:

A U2 nodule in the left thyroid lobe; otherwise unremarkable study

Abdomen:

A gallbladder polyp; otherwise unremarkable study

KUB:

Unremarkable study

Testes:

A mild varicocele on the left side

A simple epididymal cyst bilaterally

Recommendation:

Please share this ultrasound scan report with your GP or specialist doctor.

A follow-up abdominal ultrasound scan in six months is recommended.
