

Echocardiography Report of 22/05/2026

Mr. MOKHTAR FARAHMANDFAR, born on 07/06/1946 (79 years) - LPU13540

PIN: LPU13540

Clinical Indication: Heart check-up

This ultrasound examination was performed with the patient's verbal consent.

Past Medical and Medication History:

I am delighted to meet Mr Farahmandfar today.

History of myocardial infarction and HFREF

CRT-D

No PND or orthopnea

Today in the clinic, there were no clinical signs of active cardiac disease.

Atrial and ventricular pacing, HR: 60

Standard P wave shape and duration, PR standard (122 msec)

Normal QRS and QT interval (143, 472, 473 msec)

Non-specific ST.T changes

Normal axis

Preserved R progression in V4-V6

Conclusion:

LV: Normal LV size and mild systolic dysfunction (LV EF: 45-47%)

Hypokinesia in the septum at mid and apical level and Akinesia in the anterior apex.

Diastole: Mild LV diastolic dysfunction

RV: Normal RV size and preserved systolic function

Mild AO sclerosis with mild AR, mild TR

PAP: Normal PAP (PASP: 22-25 mmHg)

No PE, No Mass, or thrombus.

The pacemaker lead can be seen in the RV apex

E/Em

Sm(cm/s) 0.08

PV PGmax:

PI PG:

Study quality/Patient status/HR/ Rhythm: Technically not easy due to the wide chest / Calm /62 /Ventricular pacemaker

Left Ventricle:

-Normal LV cavity size and wall dimensions. Systolic function is mildly reduced; hypokinesia in the septum at mid and apical levels, and Akinesia in the anterior apex. was detected at rest. (LVEF: 45-47% by biplane Simpson's). Wall

thickness was standard.

Left Atrium :

Based on the volumetric assessment, the left atrium is normal in size and appearance.

Septum:

There is no obvious shunt with colour flow imaging in the inter-atrial and inter-ventricular septa. It is not possible to rule out PFO with TTE alone.

LV Diastolic Function:

Normal LV filling pressure with mild LV diastolic dysfunction. E/A: 0.65, E/Ea: 5

Mitral Valve:

The mitral valve is normal for age, with thin, mobile leaflets and good excursion. There is a normal annulus and sub-valvular apparatus. There is trace mitral regurgitation.

Aortic Valve:

The aortic valve has three cusps and appears mildly thick and calcified with good cusp separation. Mild aortic regurgitation is noted.

Aorta:

The aortic root, ascending aorta, and aortic arch appear normal in size, with no obvious abnormalities.

Right ventricle:

The right ventricle is of normal size. Systolic function is normal. The tricuspid annular plane excursion is normal.

Right atrium:

The right atrium is of normal size on volumetric assessment and appears normal.

IVC/hepatic veins:

The inferior vena cava is of normal size. There is normal inspiratory collapse.

Tricuspid valve:

The tricuspid valve has thin and mobile leaflets and appears structurally normal. Mild tricuspid valve regurgitation is present. No obvious features suggest elevated pulmonary pressures. The pulmonary pressure is within normal limits.

Pulmonary valve:

The pulmonary valve is structurally normal, with thin, mobile leaflets. There is physiologic pulmonary regurgitation.

Pulmonary artery:

The main pulmonary artery appears normal in size.

Pericardium:

The pericardium is normal with no pericardial effusion

Others:

No obvious thrombi or masses were detected in this study.

Impression:

CRT-D responder, improved HFREF

Medical follow-up

Please share this report with your GP or specialist.

Echocardiogram performed and reported by:

FARVEH VAKILIAN, M.D.

ESC core cardiology certificate

ESC Heart Failure certificate
